Celebration EHCP TARGET progression mapping

Spatial Awareness Strand Overview

The spatial awareness strand at Celebration level focuses on applying understanding of position, direction and movement in increasingly complex and abstract contexts. Pupils use spatial language, visualisation and reasoning to describe, represent and solve problems involving movement, orientation and spatial relationships, including maps and real-life scenarios.

Why is it important?

Supports navigation and independence, geometry and reasoning, and real-life application (maps, directions, movement).

Without this - pupils may struggle to apply spatial skills beyond immediate contexts

With it - pupils can visualise, represent and reason about space in practical and abstract situations

Pathway Aim –

By the end of the pathway, pupils will be able to use spatial reasoning, language and representation to describe, interpret and solve problems involving position, direction and movement across contexts.

Example evidence statements –

"The pupil draws simple maps or layouts to represent spatial relationships and use these to explain movement."
"They describe position and movement using precise mathematical language such as 'clockwise', 'anticlockwise', 'left' and 'right'."
"They follow and give multi-step directions accurately in real-life contexts."
"They use spatial reasoning to predict and explain how objects will move or appear when rotated."
"They apply spatial understanding to solve practical problems involving routes, positioning or orientation."

Representing Spatial Relationships (Band 8) Pupils represent and describe spatial relationships using drawings, models and mathematical language, applying prior knowledge of position and movement.	**Spatial Reasoning and Movement (Band 9)** Pupils use more precise spatial language and reasoning to describe movement, direction and position, including sequences and patterns.	**Spatial Reasoning, Angles & Geometry (Band 10)** Pupils apply spatial reasoning to geometric concepts, including angles, orientation and relationships between lines and movement.

Celebration EHCP TARGET progression mapping

Key stage Target By the end of the key stage, the pupil will describe and represent spatial relationships using drawings, models and mathematical language.	**Key stage Target** By the end of the key stage, the pupil will use mathematical vocabulary to describe position, direction and movement accurately.	**Key stage Target** By the end of the key stage, the pupil will recognise and reason about spatial relationships, including angles and orientation, to solve problems.
Typical evidence might include: • drawing simple maps or layouts • describing movement (e.g. turns, direction) • positioning objects based on instructions • using spatial language during play and problem solving	**Typical evidence might include:** • describing routes or directions • using precise vocabulary (clockwise, anticlockwise) • organising objects in sequences • giving or following movement instructions	**Typical evidence might include:** • identifying and comparing angles • describing orientation of lines • reasoning about turns and rotations • applying spatial understanding to solve problems
Mapped curriculum targets **Band 8** • Select shapes considering rotation and orientation • Use viewpoint language in play and construction • Draw simple representations of spatial relationships (e.g. maps) • Describe movement using mathematical language (e.g. turns) • Apply skills in real-life contexts	**Mapped curriculum targets** **Band 9** • I can order and arrange combinations of mathematical objects in patterns and sequences. • I can use mathematical vocabulary to describe position, direction and movement (e.g. straight line movement, clockwise and anticlockwise turns)	**Mapped curriculum targets** **Band 10** • I am starting to recognise angles as a property of shape or a description of a turn. • I am starting to identify right angles and relationships between turns. • I am starting to identify whether angles are greater or less than a right angle. • I am starting to identify horizontal, vertical, perpendicular and parallel lines.
Next Step: Use spatial language and reasoning to describe and organise movement and sequences	**Next Step:** Recognise and reason about angles and relationships between positions	**Next Step:** Apply spatial reasoning to more formal geometry and problem solving across mathematics
